

PLSC 448. Fall 2007.

Locate action in verbs exercise

Revise the following phrases and sentences, according to the principle to locate action in verbs.

Particle migration occurred . . .

Particle fluid migration occurred . . .

The fertilizer resulted in elevating these soil nutrients . . .

An additional confounding effect occurred from wind-blown dust which predominates in the same soil fractional sizes mentioned.

Topdressing and dust added silt and clay resulted in a reversal of analysis for these fractions.

Responses of fish may include lower age of maturity, increased growth rate, increased fecundity, and decreased disease transmission.

There was a tendency for turf to show increased growth at higher levels of nitrogen fertilization.

The positive benefit from the bacterium inoculation was particularly evidenced on root growth.

These results confirm the importance of some characteristics related to the effectiveness of autochthonous microorganisms in dry soils, which resulted in a greater nutrient acquisition and relative plant water uptake.

It is accepted that the role of soil microbes in contributing to plant establishment, growth and drought-tolerance when growing under water-stress conditions is the result of nutritional, physiological and cellular effects (Jones and Flobberblaster 2005).
